Conversational AI for Enterprise

Answer employees' and customers' questions from your policies, product documentation and help-desk guides.

Generative AI conversational search for Enterprise, Government and Science

Voice Atlas™ allows anyone to create and share unique and specific knowledge sets, and to ask them questions in plain language, with answers that cite their sources. With no coding, no model training necessary and secure by design, organizations can set up, customize and deploy a bot on any website, connect it to Slack or bring their own tools through our secure API.

Find relevant answers quickly via centralized knowledge

Activate

Bring knowledge from different places into one Atlas. Crawl your website, upload PDFs and Word, PowerPoint or Excel files, add FAQs or paste text. Connect live systems through the Model Context Protocol (MCP).

Distribute

People ask in plain language and get an answer, not a list of links like traditional keyword search. Add Chatlas™ to your website, answer in Slack or connect your own apps through a secure, key-based REST API. Every channel answers from the same knowledge.

Test and monitor

Test it in the Atlas Playground: ask the questions your users will ask and check each answer against its cited sources. When something changes, anyone you authorize can update the Atlas, with no retraining, and answers use the change as soon as it is processed.

Gain insight

A daily heatmap, your busiest days and a browsable conversation history show where your content works and where it has gaps. Export a year of conversations as a compressed JSON file. People can ask the Atlas directly instead of needing to know the right person to ask or worrying about asking a colleague.

Answers you can rely on

Voice Atlas is built to answer only from the sources you provide, cite them and say so plainly when the answer isn't there.

Answers cite their sources

Numbered citations tie each statement to its source. Cited web pages open in one click, and in the Atlas Playground so do your documents and FAQs.

No guessing outside your content

Questions your sources don't cover are declined politely instead of answered from general knowledge.

What you can do

- Answer employees' questions about your policies without them leaving Slack.
- Help customers find answers in your product documentation, on your website.
- Let Voice Atlas answer routine questions around the clock so your help desk can focus on the hard ones.

Secure by design

- **Your data stays yours.** Your content and your users' questions are never used to train or fine-tune AI models.
- **Deletion.** Deleting an Atlas removes its files, index and conversations from the service.
- **Hardened against manipulation.** Built-in defenses against prompt injection and attempts to extract your data, your instructions or answers outside your content.
